

RemotEAR Receives Patent on Remote Communications in Hearing Diagnostics

[Lederach, PA – November 6, 2018] RemotEAR, the tele-audiology company, today announced that it has received a United States patent on a system and device for remote communications in hearing diagnostics. The innovations described in U. S. Patent 10,117,605 enable a remote hearing care professional to connect and communicate with both a patient and an assistant in delivering a remote hearing diagnostics exam and counseling session.

The system provides for the ability to switch between communicating with a patient and an assistant during a remote testing session, the also implements necessary conditioning of the audio signal. The adapter can be easily inserted into a standard diagnostic equipment configuration, enabling either permanent or temporary remote operation for testing and interactive counseling by a hearing care professional in an office setting.

The patented RemotEAR Audio Adapter is offered as part of a series of tools and services that the company provides to organizations wishing to implement an effective tele-audiology program and extended patient hearing care delivery model.

About RemotEAR

RemotEAR holds key patents for remote diagnostics and hearing instrument programming and offers a unique tele-audiology service for the professional hearing care industry. As the only company solely focused on tele-audiology, RemotEAR has provided project planning, management, and implementation services to both public and private organizations. The company's Deviceware[®] technology platform enables hearing care professionals to remotely administer diagnostic patient testing and hearing aid adjustments, providing important benefits for both the patient and the provider.
